Just follow the sound of the river...

Eawag, Switzerland 23rd November – 14th December 2011

Just follow the sound of the river...

What sounds like a mantra in Eastern Philosophy has in fact a worldly source in the encounter between the artist Surekha *1 from Bengaluru (India) and the natural scientists (water ecologists) in Switzerland. “Just follow the sound of the river...” is the art project Surekha created during her three months residency in the Swiss Federal Institute for Water Research, Eawag, near Zurich, Switzerland.*2 Developed as part of the Indo-Swiss artists-in-labs Residency Exchange *3, Surekha's residency at the Department of Aquatic Ecology introduced her to a range of research activities, including the ecology of alpine streams, the population ecology of aquatic insects, and limnological investigations in the Swiss National Park. While working alongside scientists in a research environment for an extended period of time was new to the artist. However it was not the first time that Surekha had worked on the subject of water. A previous art project “focusing the urban rural margins – Jakkur Lake 2008-2011” includes photography and video-interviews, focused on the Jakkur lake, 15km outside of Bangalore, where the lake and its surroundings play an important role not only for the ecosystem of the area but also for the rural community around the lake. The work she produced clearly reflects the influence of the scientific and the social coming together as a means to understand the place and value of water.

To understand Surekha's work requires that we explore the process through which she developed her concept and the ideas that materialized in a participative multimedia installation at the end of her residency. On the one hand this is a process that unfolds the poetic, visual and aesthetic qualities of water on a micro and on a macro level, and on the other hand, this is a process that expands the local ecological and social role of water within its global, political and philosophical dimensions. Water here is both a commodity and an element essential for life. During the first weeks at Eawag, Surekha learnt about water ecology through courses, conferences, speaking to the scientists and looking at water and aquatic organisms under the microscope. Zooming into the materiality of water Surekha discovered a new, strikingly beautiful, living world, and was soon captured by the “water-bubbles”, air-inclusions in water. She started researching the visual differences of these water-bubbles looking at water samples from different lakes and streams in the area, and samples of tap water, and of warm and cold water. Her findings are gathered and re-interpreted in a large-scale composition of “water-bubbles” from microscopic images. Further elements of “Just follow the sound of the river...” were inspired by Surekha's shadowing of scientific fieldwork in the mountains, where she observed the systematic gathering of data (water samples) in specific research sites and monitoring - in this case the basin of the Morteratsch glacier (2020m) and hydro-electric dam stream bank in Graubünden. In a video-essay the artist juxtaposes her gathering of poetic visual material on the aquatic landscape with the scientists gathering of aquatic samples.

Like a river, Surekha's work meanders, finding its way through different landscapes and altitudes, making new branches and by doing so creating new landscapes. Rivers do not know community or Country boundaries, their course requires that we view them as a continuous system. A core part of Surekha's work-in-progress was to engage with this systemic understanding of rivers. She asked people from all over the world to send her water samples with an image of the source from where the sample was taken. Over 160 water-samples in flasks and vessels of all kinds and shapes from over 25 countries, together with images and stories about the source of this water have since arrived at Eawag. Arranged during the installation what we saw was clear water, no visible difference between the samples, differences being narrated by the images and stories of the waters collection or rendered visible by the eye of the microscope.

By taking such a participatory approach, enrolling the scientists, her local community at Eawag as well as friends and colleagues across the world Surekha's work reminds us of our universal need for water, of its apparent ubiquity, but also the stark variations in quality and amount of water resources around the world. To be able to view, and hence to effect change on a large system, like the global hydrological cycle, takes local actions and a participatory approach.

Exhibiting Surekha's artistic responses to scientific research can open up these discussions with the general public in different cultural contexts. Thus a different perspective is offered about Contemporary art, one that questions if scientific metaphors are too literal or art too abstract and allow the public to have a deeper access to the scientific research. Visitors are invited to "think" about art and at the same time "engage with" some of the most current developments and discourses in Aquatic Research.

Irène Hediger, AIL
Co-Director of the Swiss artists-in-labs
